LIVE ONLINE ROBOTICS · CLASS 8+

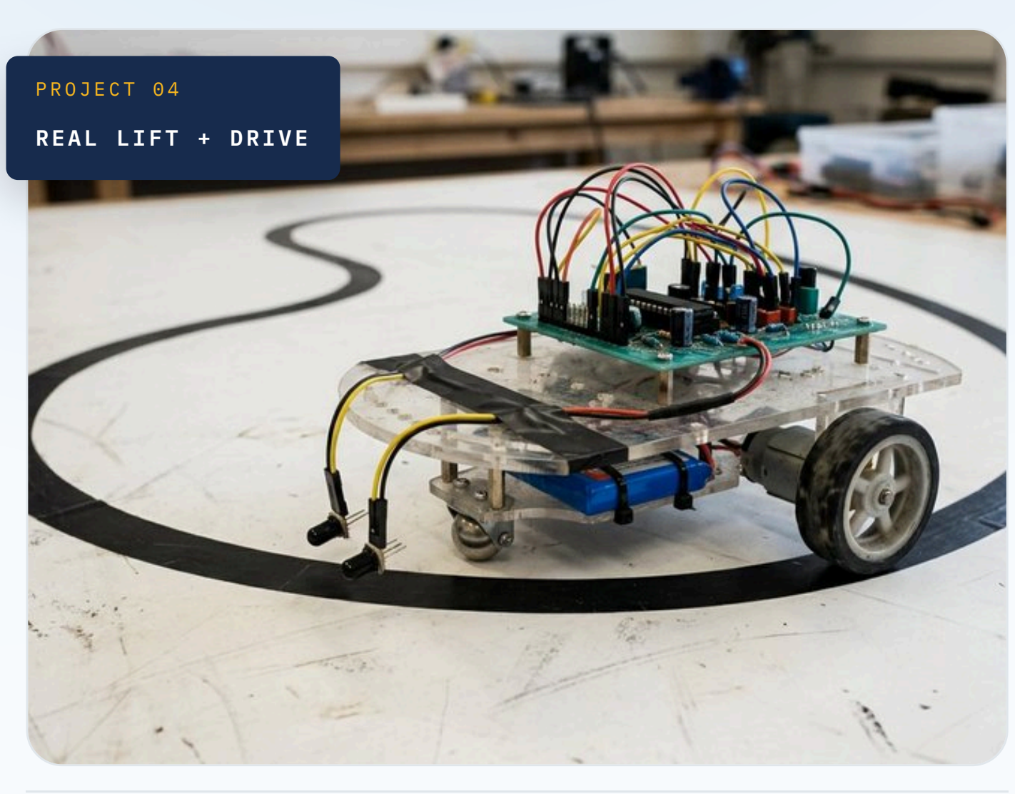
Where teenagers learn to build like real engineers.

Five to six months on an ESP32-S3 board, with a mentor your child can ask. They work through 50+ guided builds and finish three robots they keep.

> Not a toy version of engineering. The same board, the same faults, the same fix.

See the learning path Ask about the programme

For teenagers, typically age 14+ · No prior coding required



Motorised Forklift A build that has to move, lift, and stay under control.

WHERE OUR STUDENTS HAVE COMPETED

ATL Marathon · Avishkaar IRC · Makeathon · MP State Science Fair · CBSE Skill 417

Your child is bright. The report card says "has potential". Nobody can tell you what they are good at.

You have probably paid for something educational before and watched it go nowhere. Most of it either fixes a grade or fills a Sunday. This does neither. It produces twelve objects you can pick up.

OUR IMPACT

Four cohorts in, here is the whole record

Every robot built and every student taught. Small numbers, because we started in 2024.

ROBOTS BUILT	STUDENTS TAUGHT	GUIDED BUILDS	CAPSTONE ROBOTS	GUIDED BUILDS
142	68	50+	3	50+

IT DOES NOT BEGIN WITH A ROBOT

It begins with one part, one question, and a chance to see what happens.

They do not watch an explanation on a screen. They connect a part, test what happens, make a change, and see the machine respond.

ESP32 brain board · 50+ guided builds · 3 capstone projects

PICK A PART

- ESP32 brain board
- Sensors
- Motors
- Servos

ESP32 BRAIN BOARD

It runs the code and tells the rest of the machine what to do.

In a session: The student writes code, uploads it, and sees something physical respond.

`MicroPython-ready` `4 motor drivers` `2 sensor ports`

THEN THE STUDENT REPEATS A SIMPLE LOOP

01 Connect the part
02 Test what happens
03 Find the fault
04 Change one thing and test again

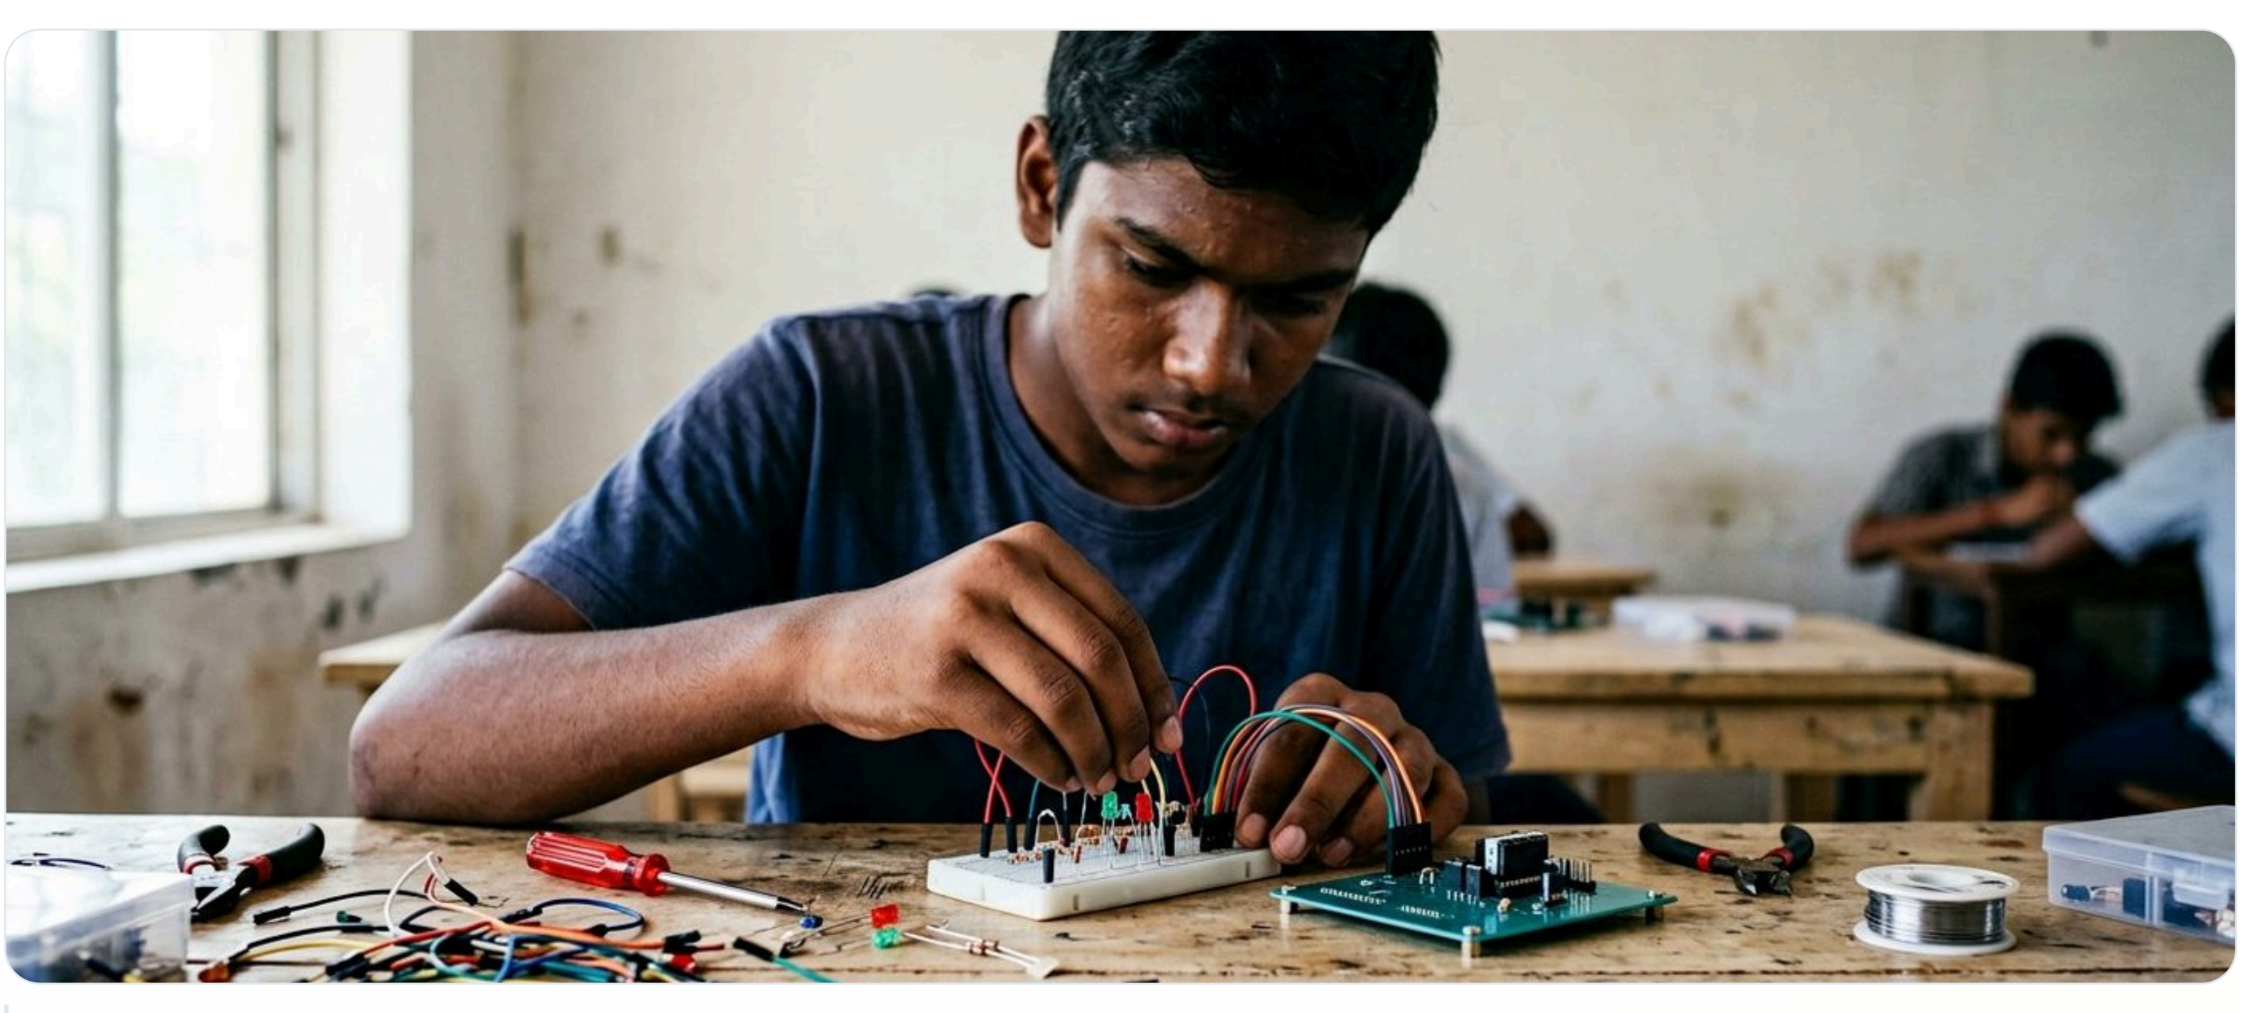
One component becomes a response. A few responses become a build. Then the question changes: **what else can I make it do?** It is learning that leaves the screen and stays in their hands.

BEFORE YOU COMPARE

Your Guide to the Words We Use

Six terms you will hear from us, and from anybody else selling this.

Brain Board	Our own ESP32-S3 board. The same chip family sits inside real IoT products.
Sensor	Measures one thing and reports it. Without sensors a robot cannot react.
Breadboard	Build a circuit without soldering. Wires pull out, so a mistake costs nothing.
MicroPython	The language they start in. Readable, forgiving, used by working engineers.
Capstone	One of three finished robots: Sentry X1, Rover Tank, Shadow Arm.
Kokoon CodeLab	Our editor. Start with blocks, move to MicroPython, send it to the robot over Wi-Fi.

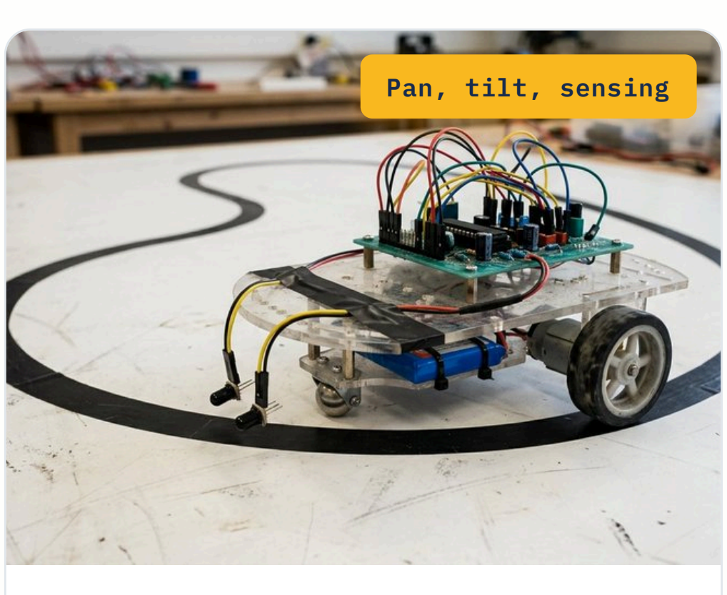


Week two. Wiring a distance sensor. Nothing works yet.

WHAT YOU GET

What Do They Actually Have at the End?

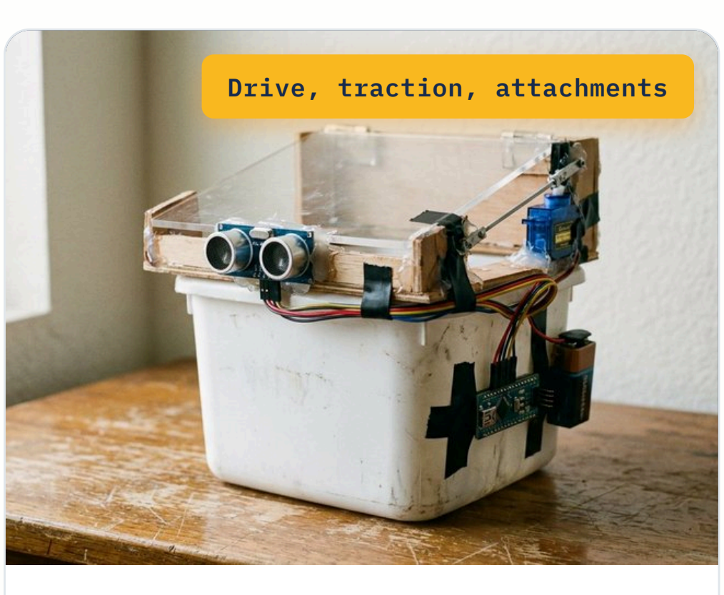
Three finished robots, photographs and video of every build, and the code they wrote for each one.



SENTRY X1 | CAPSTONE 01 | 3D-PRINTED BUILD

Nerf-style turret

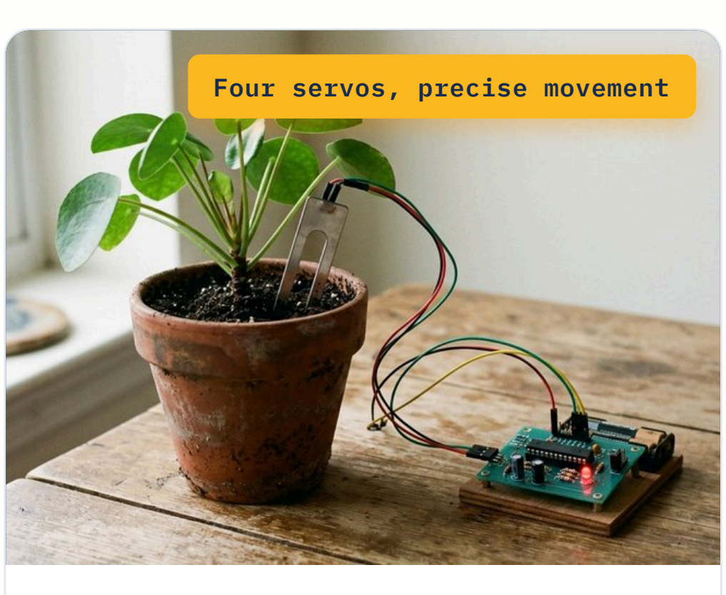
A full pan-and-tilt aiming mechanism that fires darts. Two servos for the axes, a sensor to find the target, and code that has to hit something moving.



ROVER TANK | CAPSTONE 02 | 3D-PRINTED BUILD

Configurable 4×4 rover

Wheel drive or tank tracks, swapped by the student. Mounts for extra sensors, so the same chassis becomes a different experiment each time.



SHADOW ARM | CAPSTONE 03 | 3D-PRINTED BUILD

Four-servo robotic arm

Move the small control arm and the large one mirrors it. Four servos held to an exact angle, which is the hardest control problem in the kit.

Every student finishes all three. None of them had wired a circuit before week one.

Plus 50+ smaller guided builds along the way.

See the three capstones

WHAT YOU WILL NOTICE

What changes at home

The classroom is our problem. This is what you see at home.

MONTH 1	MONTH 2	MONTHS 3 TO 4	MONTHS 5 TO 6
They start explaining things to you at dinner.	They stop asking you to sit with them while they work.	They take criticism about their work without falling apart.	They start talking about what things cost to make.

WHEN THE BUILD GETS DIFFICULT

The student gets help. You do not become the instructor.

Real hardware has real faults: a loose connection, a motor wired the wrong way, code that produces a surprise. That is where most kits are left unused.

KokoonLabs gives your child a teaching assistant to ask in live doubt sessions and chat. They stay with the cause, learn how to test it, and keep the project moving without you having to troubleshoot after work.

For the child	For the parent
Live doubt sessions and chat	**Progress updates**

Build coins can be redeemed for discounted 3D parts and extra sensors, so the next experiment has somewhere to go.

HOW IT RUNS

Four stages, five to six months

Each stage ends with something finished. The full week-by-week breakdown is on the programme page.

01	02	03	04
Month 1	Month 2	Month 3–4	Month 5–6
The first spark	**Learning to think it through**	**Building their own idea**	**The capstone**

See what happens in each stage

WHAT THEY FINISH WITH

Work they can hold, demonstrate and explain

At the end there is no certificate to file away. There are three working robots on the table, fifty-odd smaller builds behind them, and a child who can tell you how each one works.

A portfolio, not a report

Photographs and video of every build, with the code they wrote. Useful when a school or a competition asks what they have made.

Skills that carry

MicroPython, sensors, motor control and debugging transfer straight into engineering college and robotics competitions. Nothing needs relearning.

Confidence that shows

The change most parents mention is not technical. It is a child who volunteers to explain something instead of waiting to be asked.

BEFORE YOU DECIDE

Is this right for your child?

We would rather have an empty seat than a student who stops coming in week three. One in six families who book a free class is told to wait a year.

This suits your child if they

- ☑ Takes things apart to see inside
- ☑ Gets frustrated but comes back to it
- ☑ Asks how things work more than why
- ☑ Is somewhere in the middle at school, not at the top
- ☑ Has never been given a real tool

Wait a year if your child

- ☐ Is in Grade 10 with boards this year
- ☐ Needs a maths or science grade fixed
- ☐ Has never finished a long project and is not ready to try
- ☐ Would rather be doing something else on a Saturday

Read the honest argument

NEXT BATCH STARTS 12 SEPTEMBER

Sit in on one class

The first class is free and you are welcome to watch it with them. Ninety minutes on camera tells you more than this website can.

Book a free class

Kokoon Labs

Engineering and enterprise, taught together, to Class 8–10 students across India.

Grades 8 to 10 | Live online | 5 to 6 months | ₹30,000, kit couriered

STEP 2 OF 5 · IS IT FOR US? — BEFORE YOU DECIDE

Is this worth the money?

The case for it, including the parts against us.

What is a robotics engineering programme, and does it really help my child?

It is a robotics course built around real hardware rather than a screen. Your child works through 50+ guided builds and finishes three capstone robots they keep.

Most robotics classes hand over a kit and a video. Ours assigns a Teaching Assistant, so when a servo jams at 9pm the child asks them, not you.

It helps in three ways:

> **It Builds Judgement:** They decide what to make, what to charge and what to cut. Nobody marks those decisions. They find out when a buyer says no.

> **It Builds Follow-Through:** Interest runs out around week nine. There are months after that, with a deadline and three teammates waiting. Getting past it is most of what they learn.

> **It Builds a Record:** Three finished robots, 50+ builds behind them, and video of each one working. A report card shows none of that.

It will not raise a maths grade. If your child needs marks this year, coaching is the better spend.

How to tell a good robotics programme from an expensive one

Six things worth checking, whoever you are speaking to. One of them we would fail.

1. **Ask to see the full curriculum before you pay.** If it is only available after a phone call, there is a reason. Ours is on this site.
2. **Ask how many students are in a batch.** Above twelve, your child will not be known by name. We cap at eight.
3. **Ask what happens when something breaks.** A programme that charges for replacement parts is selling you a kit.
4. **Ask who is actually in the room.** Not the founder's credentials. The person who will sit with your child on a Saturday.
5. **Ask what happens if your child wants to stop.** Look for a refund window and a way to pay in parts. If the whole year is due upfront and non-refundable, that tells you what they expect.
6. **Ask how long they have run and how many finish.** We would fail this one. Four cohorts. Our completion numbers are too new to mean much. Ask us again in two years.

CBSE teaches computational thinking and AI from Grade 3. For Grades 6 to 8 it is marked by project, not exam. Skill Subject 417 covers it at Grades 9 and 10. So the work your child does here can go towards school submissions.

Most Grade 9 students can explain how a sensor works. Very few have wired one up and had it not work. Finding the fault and fixing it takes time a school timetable does not have. That gap is what this programme is for.

Software is getting better at writing code. It is not getting better at spotting a problem worth solving, or at building a thing that works.

— HONEST FILTER

Is your child ready?

One in six families who book a free class is told to wait a year.

This suits your child if they

- ☑ Takes things apart to see inside
- ☑ Gets frustrated but comes back to it
- ☑ Asks how things work more than why
- ☑ Is somewhere in the middle at school, not at the top
- ☑ Has never been given a real tool

Wait a year if your child

- ☐ Is in Grade 10 with boards this year
- ☐ Needs a maths or science grade fixed
- ☐ Has never finished a long project and is not ready to try
- ☐ Would rather be doing something else on a Saturday

— AFTERWARDS

Where this leads

Parents of a Grade 9 student are thinking three years ahead. This is what the year opens up, and it is not an engineering seat.

Competitions

Students who finish stage two can enter ATL Marathon, Avishkaar IRC and Makeathon. We prepare them in class and pay the entry fees.

Grades 11 and 12

Schools that ask what a student has built outside class will accept the portfolio. It also covers Grade 11 and 12 project work.

Carrying on

Some students come back as assistants in the next cohort. It is unpaid, it is one Saturday a month, and we cap it at four.

— QUESTIONS

What parents ask us

Is this an expensive hobby class?

For the first three months it looks like one, and if we stopped there you would be right to call it that. Stage four is the difference. Your child sets a price and sells to somebody with no reason to be kind about it. We have not found another programme in India that does that part.

Will this affect board preparation?

What if my child loses interest?

We are not in Bengaluru. Does that matter?

Why does it take four to six months and not a fixed term?

STEP 3 OF 5 · THE PROGRAMME

The Robotics Engineering Programme

Five to six months, four stages, 50+ guided builds and three capstone robots. ₹30,000 including the kit, which they keep.

Book a free class | See the fees

24 WEEKS

12 MACHINES BUILT

8 STUDENTS PER BATCH

90 MINUTES PER WEEK

WHAT YOU GET TO USE

Grades 8 to 10 only. There is no junior version of this.

- **ESP32-S3 Brain Board** The same chip family used in real IoT products. Not a teaching toy.
- **Ultrasonic and IR** Distance, light, moisture, temperature. Five sensor types your robot reads.
- **Motors and servos** Two drive motors and an SG90 servo. Enough to make something that moves and grips.
- **Real money** You set the price. You keep what your robot sells for.

THE PROGRESSION

Four stages

Four to six weeks each. Every stage ends with something finished.

01
MONTH 1

STAGE ONE

The first spark

No screens for the first three weeks. Your child learns what current and resistance do by wiring things wrong and then working out why. Most of them get an LED lit in the first class and take it home in their pocket.

`Breadboarding` `Sensors` `Motors` `Soldering`

✓ 68 students have finished this stage

02
MONTH 2

STAGE TWO

Learning to think it through

Block coding first, then real Arduino. The robot starts making its own decisions. This is the stage where parents tell us their child has stopped asking for help with everything.

`Arduino` `Loops` `Line follower` `Costing`

✓ 54 students have finished this stage

03
MONTH 3–4

STAGE THREE

Building their own idea

They stop building what we set. Everyone picks a problem they have noticed and builds something for it. Then somebody who has never seen it tries to use it. It usually fails. Then they fix it.

`Tinkercad` `3D printing` `IoT` `User testing`

✓ 41 students have finished this stage

04
MONTH 5–6

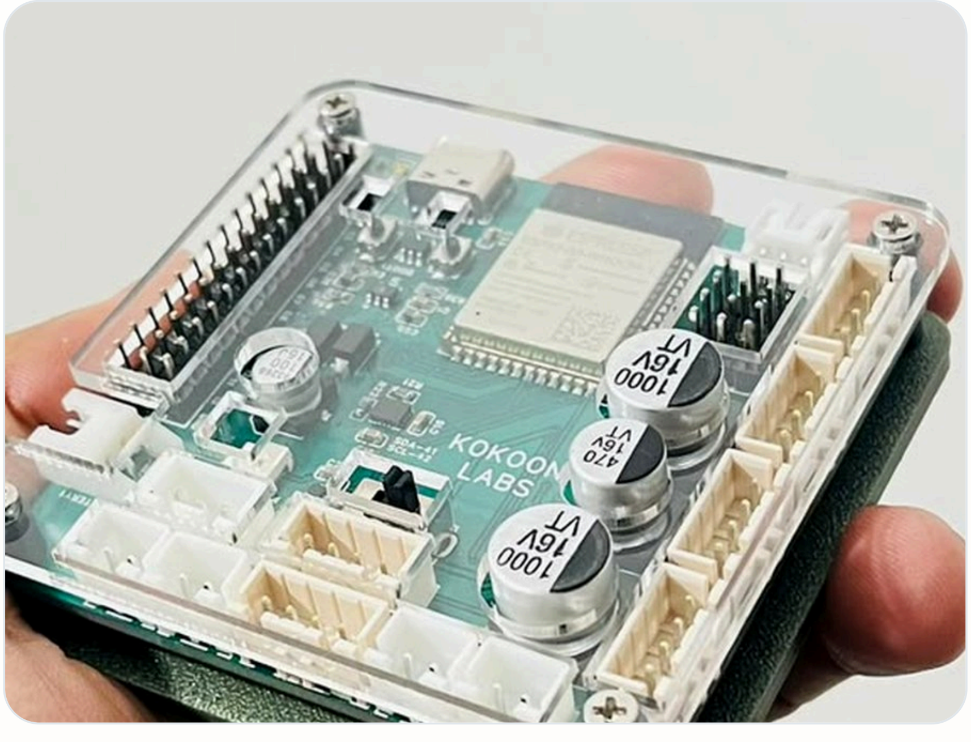
STAGE FOUR

The capstone

The capstone build, made properly. Your child assembles the 3D-printed parts, wires four servos, writes the control code, and presents the finished machine to their TA and cohort.

`Assembly` `Servo control` `Debugging` `Demonstration`

✓ 34 students have finished all three capstones



WHAT'S IN THE BOX

Real components

A college student could pick up this exact kit. We made it approachable for a fourteen-year-old, not simpler.

Brain Board	ESP32-S3, our own PCB
Motor and servo	4× motor drivers, 4× servo ports
Expansion	2× I2C, 2× sensor ports, RS485
Sensors	Full suite for hands-on experiments
3D-printed parts	Every part for all three capstone builds
Power	Protected battery pack, safe voltages

Included in the fee. Nothing to buy later. If a part goes missing, ask us and we will post you another.

INCLUDED

What ₹30,000 covers

Six things. There is no second invoice at any point.

☑ **The kit**
Arduino board, five sensor types, motors, chassis parts. Theirs to keep at the end.

☑ **The curriculum**
24 classes, published in full on this site. Nothing hidden behind a phone call.

☑ **The mentors**
Eight students per batch. Police verified. Each one builds the curriculum before teaching it.

☑ **The portfolio**
Photographs and video of every machine, plus the costing sheets, on a page they can share.

☑ **Kokoon CodeLab**
Our own editor. Start in blocks, graduate to real MicroPython, and deploy to the robot wirelessly.

☑ **Replacement parts**
Something breaks or goes missing, you ask, we post another. No charge and no explanation needed.

Questions

My child has never coded.

Most of ours had not either, and most were quietly nervous about it on the first day. The first three weeks have no screens, only circuits. They learn what the code controls before they write any.

Will my child be left stuck on a problem?

Is it safe? There is a soldering iron in the kit.

What are build coins?

What do they take home at the end?

`Grades 8 to 10` | `Live online` | `5 to 6 months` | `₹30,000, kit couriered`

STEP 4 OF 5 · FEES — FEES

Rs.30,000, and here is exactly where it goes

₹30,000 is a lot of money. Everything is on this page. If the number does not work for your household, find that out now, not after a phone call.

FULL PROGRAMME · 5 TO 6 MONTHS

₹30,000 EVERYTHING INCLUDED

That is a mid-range phone, or about five months of coaching. We could break it into a monthly number to make it look smaller. We would rather write the number down.

- 24 live classes of 90 minutes, eight students per batch
- The full kit, which they keep
- Tools, 3D printing and all materials
- A dedicated Teaching Assistant, live sessions and chat
- A portfolio page with photos and video of everything they built
- **Every robot and every part stays with your child**

Book a free class

`EMI from ₹5,150 a month over six months · second child 10% off`

☑ **The first class is free**
Ninety minutes online, with a mentor and a small group. You decide afterwards.

☑ **Seven days to change your mind**
Full refund within a week of the first class. There is no form to fill in.

☑ **Nothing in February or March**
The programme stops for boards and picks up again in April.

☑ **You can pay stage by stage**
₹9,000 every six weeks instead. It costs a bit more in total and you can stop at any point.

— THE BRACKET

What else ₹30,000 buys

You are comparing us to the other things that money could go on. Here they are.

A MID-RANGE PHONE	FIVE MONTHS OF COACHING	THIS PROGRAMME
₹25,000 to ₹35,000	**₹6,000 a month, roughly**	**₹30,000, one time**
Lasts about three years. Replaces one they already have.	Buys marks in one subject, if they turn up and do the work.	Real hardware they keep, 50+ builds, and three finished robots.

The coaching comparison is the fair one. If your child needs marks in a subject this year, coaching is the better spend and we will tell you that on the phone.

All programmes

PROGRAMME	LENGTH	FEE	PER WEEK	KIT
Robotics Engineering Four stages, ends in a real sale	5 to 6 months	**₹30,000**	₹1,041	`Included, kept`
Pay by stage Same programme, decide each stage	6 weeks each	**₹9,000** / stage	₹1,250	`Included, kept`
Six-Week Sprint One product, one sale	6 weeks	**₹5,999**	₹1,000	`Starter kit, kept`
Summer Workshop Holiday intensive	3 weeks	**₹8,999**	—	`Included, kept`
Free trial One session, no obligation	90 min	**Free**	—	`Keeps what they build`

EMI
₹5,150 × 6 months through Razorpay. No cost EMI on selected cards.

Sibling discount
10% off the second child, applied automatically at enrolment.

Early-bird
15% off the first four seats in each batch.

> **Not charged for.** The kit and its courier, consumables, 3D-printed parts for every build, replacement parts, class recordings and the certificate. There is no second invoice.

— FEE HELP

If the fee is the problem, say so

We keep two part-funded seats in every batch for families where cost is the barrier. There is no form and no paperwork. You email us, we have a conversation, and it stays between us.

Write to us about a funded seat

Grades 8 to 10 | Live online | 5 to 6 months | ₹30,000, kit couriered

STEP 5 OF 5 · BOOK A FREE CLASS — FREE TRIAL

Book a free class

Nobody should spend ₹30,000 on a description of a class. Your child joins one live online class for ninety minutes, meets the mentor and builds a circuit in simulation. There is nothing to pay afterwards unless you decide to enrol.

What happens

1
0–15M

They meet the batch

Eight students, one mentor. Most arrive nervous and stop being nervous somewhere in the first fifteen minutes.

2
15–60M

They build a circuit

A light-triggered buzzer. It will not work the first time.

3
60–90M

They take it home

Theirs to keep whether or not you enrol. Then we talk to you for ten minutes about whether this suits your child, including when we think it does not.

We will tell you if it is not a fit. One in six families is pointed to a shorter format, or told to come back after boards.

Book a seat

We will message you on WhatsApp within two hours to confirm a time.

Your name

Parent or guardian

WhatsApp number

+91

We message on WhatsApp. We will not cold call you.

Child's class

Grade 8

Preferred

Saturday morning

Anything you want to ask first?

Optional. Most parents ask about boards.

Book my child's free seat

6 of 8 seats remaining in Batch 04

Prefer to talk?

Call +91 00000 00000 between 10am and 7pm. You will get a mentor, not a salesperson.

Before you book

Are the classes live, or recordings?

Live. A fixed slot each week, eight students, one mentor, ninety minutes on camera. If your child misses one we send the recording, but the programme is built around them being there.

What do we need at home?

Do I have to sit with my child during class?

My child is in Grade 7. Can they join?
